- MCV4 – Booster vaccine against bacteria that causes Meningococcal Meningitis.

### **Immunization Policy – Child Plus Pediatrics**

We believe that all children, unless there are medical contraindications, should be fully immunized per the vaccine schedule recommended by the American Academy of Pediatrics (AAP) and the Center for Disease Control (CDC). We are unable to accept new patients/families unless they are willing to fully comply with the recommended timetable. We believe this policy advocates for children and their best interest, as well as protects our patients who are too young to be vaccinated. If you are transferring from another practice, you will need to bring a copy of your child's immunization records to your child's first visit in order to be seen.
